INTRO TO JMP – PART 3

Bootcamp

August 7, 2022 Prepared by Jay / [TDMDAL](#)

Rotman School of Management
UNIVERSITY OF TORONTO

Quick Review of Session 2

- Join data tables
 - Many ways of joining two tables
 - Inner join, left join, left join with exclusion, etc.
 - Combing data manipulation operations to achieve a task (high-value customers)
 - Point-and-click
 - good for getting quick result
 - not too convenient for long pipeline data transformation (Reproducibility is a big issue)
 - For data manipulation on large dataset, order of operation steps could affect performance
 - Hard: turn a problem into implementation steps (algorithm); Easy: learn tools/languages
- JMP graphing
 - Graph builder

Plan

- Session 1
 - Workflow overview
 - Basic data manipulation
- Session 2
 - Join data tables
 - JMP graphing
- Session 3
 - **Modelling**
 - JMP Journal
 - JMP Scripting Language

Modeling in JMP

- Linear regression (done)
 - predict a continuous variable
- Logistic regression: predict categorical variable
 - supervised classification learning
 - e.g., binomial logistic regression: the categorical variable has binary outcomes (e.g., 0, 1)
- K-mean clustering: a method to partition observations (into clusters)
 - unsupervised classification learning
- Model selection
 - Validation Column and Model Comparison
- Outliers, missing values, and patterns

Note: the purpose of modelling isn't just prediction.

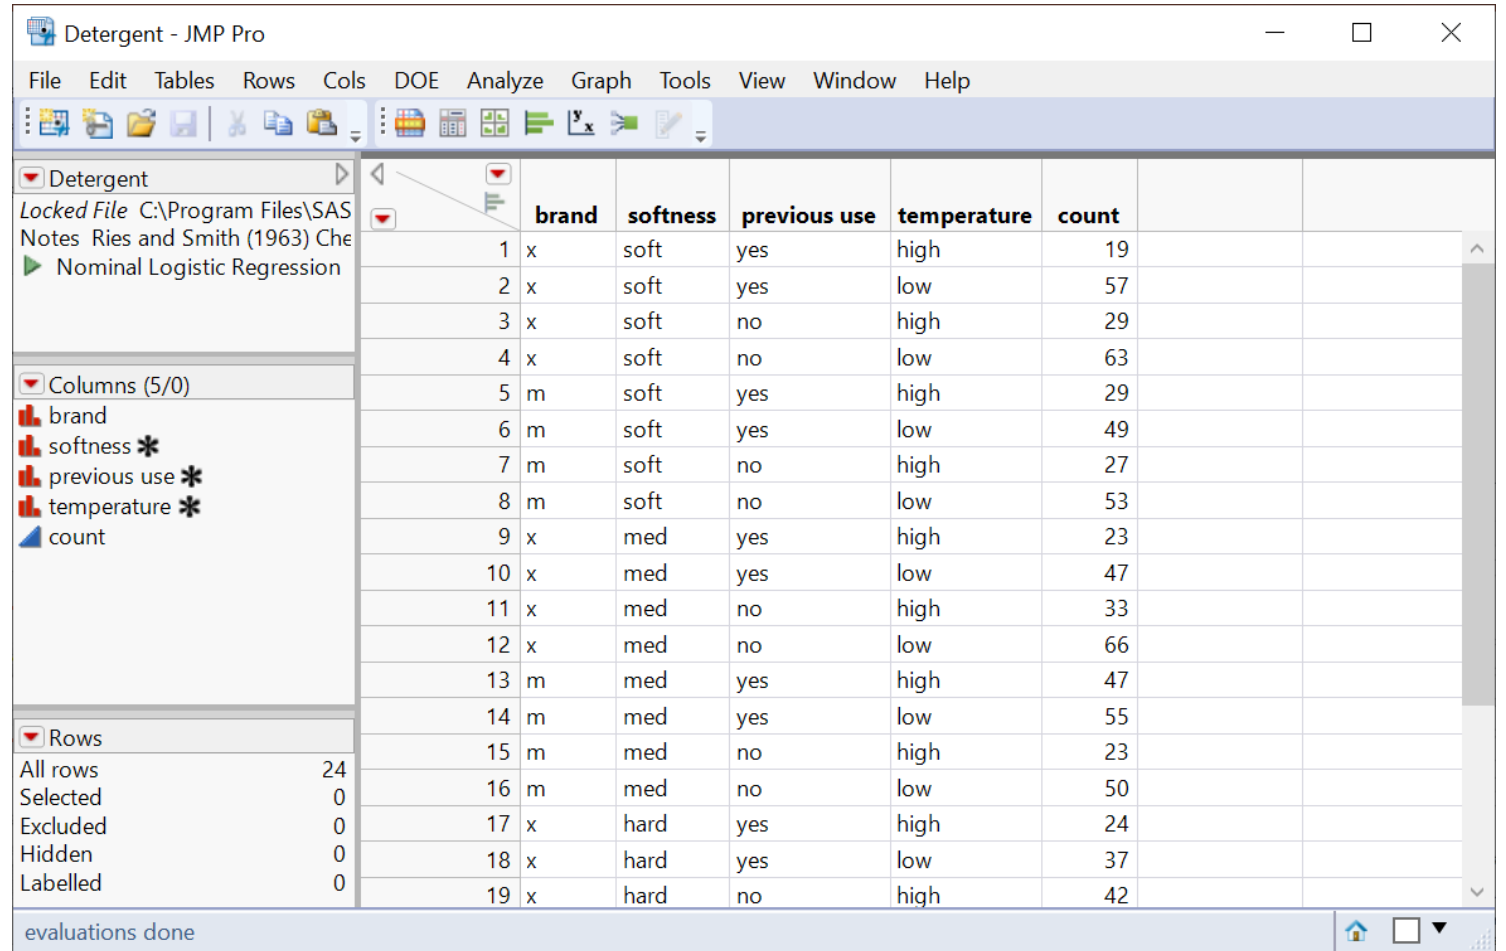

Binomial Logistic Regression

- let Y be the binary outcome variable
 - e.g. $\{0, 1\} = \{fail, success\}$
- Let $p = prob(Y = 1)$; $\frac{p}{1-p}$ is then the odds of being 1 (or success)
- Binary logistic regression models the logit-transformed probability as a linear relationship with the predictor variables
 - maximum likelihood estimation

$$\text{logit}(p) = \log\left(\frac{p}{1-p}\right) = \beta_0 + \beta_1 x_1 + \cdots + \beta_k x_k.$$

Binomial Logistic Regression (Demo): Data

- Preference for a brand of detergent (Ries and Smith, 1963)
 - Help > Sample Data Library
 - Detergent.jmp
- Survey Questions
 1. which brand do you prefer, x or m
 2. water softness
 3. previous user of m
 4. water temperature

Detergent - JMP Pro

evaluations done

Binomial Logistic Regression (Demo): Fit

- Analyze > Fit Model

Fit Model - JMP Pro

Model Specification

Select Columns: 5 Columns

- brand
- softness
- previous use
- temperature
- count

Pick Role Variables:

- Y: brand (optional)
- Weight: optional numeric
- Freq: count
- Validation: optional
- By: optional

Construct Model Effects:

- Add: softness, previous use
- Cross: softness*previous use
- Nest: temperature, softness*temperature
- Macros: previous use*temperature, softness*previous use*temperature

Degree: 2

Attributes: [dropdown]

Transform: [dropdown]

No Intercept

Personality: Nominal Logistic

Target Level: m

Buttons: Help, Run, Recall, Remove

Keep dialog open

Binomial Logistic Regression (Demo): Report

- Overall model fit is significant
- Softness doesn't seem to contribute too much
 - [Likelihood ratio test](#)
- ROC Table
 - [sensitivity, specificity, etc.](#)
 - Tools -> Help

Your Turn (Hands-on)

- Do the same analysis without the softness variable
- Save the analysis script in the data table
- Challenge
 - How to construct a table of *correct classification rate* at each probability cutoff?
 - What cutoff gives the best correct classification rate?

$$\text{correct classification rate} = \frac{\text{true positive} + \text{true negative}}{\text{total \# of predictions}}$$

K-Means Cluster Analysis

- A method to partition n observations into k clusters
 - such that total within-cluster sum of squares (between observations to cluster centroid) is minimized
- A **cluster** refers to a collection of data points aggregated together because of certain similarities
- Need to set k
 - There are methods to help you decide the value of k

K-Means Cluster Analysis: An Example

- Observations: 150 2-d points
- Set $k = 3$
 - partition each observation to one of the 3 clusters $S = \{S_1, S_2, S_3\}$
- K-means clustering algorithm finds 3 clusters such that

$$\operatorname{argmin}_S \sum_{i=1}^3 \underbrace{\sum_{x \in S_i} \|x - \mu_i\|^2}_{\text{Within-cluster sum of squares}}$$

Within-cluster sum of squares

K-mean Cluster Platform (Demo)

The image displays the JMP Pro software interface with several overlapping windows. The main window shows a data table with columns 'x' and 'y' and rows 1 through 19. The 'Analyze' menu is open, with 'Clustering' > 'K Means Cluster' selected. The 'K Means Cluster - JMP Pro' dialog box is open, showing '2 Columns' selected and 'Columns Scaled Individually' checked. The 'cluster - K Means Cluste...' dialog box is also open, showing 'Iterative Clustering' selected and 'K Means NCluster=3' in the control panel. A third dialog box, 'cluster - K Means Cluster ...', is open, showing a table of results for 'Iterative Clustering' and 'Cluster Comparison'.

cluster - JMP Pro

Row	x	y
1	2.6	0
2	0	0
3	0	0
4	0	0
5	2.6	0
6	1.5	0
7	1.7	0
8	2.3	0
9	-2.1	0
10	1.7	0
11	3	0
12	-0.3	0
13	-1.8	0
14	0.7	0
15	0.1	0
16	-1.99912714	2.71285741
17	-1.47804153	3.2093591
18	1.8706766	0.77797407
19	-1.5933443	2.76898682

K Means Cluster - JMP Pro

Clusters rows based on numeric variables into a specified number of clusters.

Select Columns: 2 Columns (x, y)

Cast Selected Columns into Roles: Y, Columns (x, y)

Weight: optional numeric

Freq: optional numeric

By: optional

Columns Scaled Individually

Action: OK, Cancel

cluster - K Means Cluste...

Iterative Clustering

Control Panel

Method: K Means Cluster

Number of Clusters: 3

Range of Clusters (Optional):

Single Step

Use within-cluster std deviations

Shift distances using sampling rates

Go

cluster - K Means Cluster ...

Method	NCluster	CCC Best
K Means Cluster	3	20.5376 Optimal CCC

- Biplot 3D
- Parallel Coord Plots
- Scatterplot Matrix
- Save Colors to Table
- Save Clusters
- Save Cluster Formula
- Publish Cluster Formulas
- Simulate Clusters
- Save Cluster Distance

Creates table column

Your Turn (Hands-on)

- Import the country_risk.xlsx data (data/basics/country_risk.xlsx)
 - note that it's an Excel file and column header starts at row 2
- Perform a pair-wise correlation analysis across the following 5 variables
 - Corruption, Peace, Legal, GDP Growth, Population
 - Note that Corruption and Legal variables are highly correlated
 - hint: use the Multivariate platform
 - Menu: **Analyze -> Multivariate Methods -> Multivariate**
- Perform a K-means cluster analysis
 - As a start, use Peace, Legal and GDP Growth as factors; and set k=3
 - Produce a scatterplot matrix
 - Can you label each cluster (high-risk, medium-risk, etc.)?
 - Hint: check Cluster Means

Model Selection

- Modeling for causal inference
 - Valid each model to check model assumptions are satisfied
 - e.g. analysis of residual in linear regression
 - Pick a common metric to compare across models and pick the best one
- Modeling for prediction
 - Training, validation, and test data split
 - Training data: train/fit a model
 - Validation data: tune a model, and select the final best model based on a certain metric
 - Test data: obtain an unbiased performance measure of the final chosen model

Validation Column and Model Comparison

The screenshot displays the JMP Pro interface for a project named 'companies_mma'. The 'Analyze' menu is open, showing options like 'Fit Model' and 'Model Comparison'. The 'Model Comparison' dialog box is active, showing the selection of columns for comparison. The 'Model Comparison' results table is also visible, showing performance metrics for different models.

Model Comparison - JMP Pro
Compares performance across models using prediction formula columns.

Select Columns: 10 Columns
 Type
 Sales (\$M)
 Profits (\$M)
 # Employ
 Assets
 sales/emp
 size
 Validation
 Pred Formula Profits (\$M)
 Pred Formula Profits (\$M) 2

Cast Selected Columns into Roles:
 Y, Predictors: Pred Formula Profits (\$M), Pred Formula Profits (\$M) 2 (optional)
 Group: Validation (optional)
 Weight: optional numeric
 Freq: optional numeric

Model Comparison
Predictors
Measures of Fit for Profits (\$M)

Validation	Predictor	Creator	.2	.4	.6	.8	RSquare	RASE	AAE	Freq
Training	Pred Formula Profits (\$M)	Fit Least Squares					0.5482	319.22	213.24	24
Training	Pred Formula Profits (\$M) 2	Fit Least Squares					0.1261	443.97	294.59	24
Validation	Pred Formula Profits (\$M)	Fit Least Squares					0.0437	1213.1	602.01	8
Validation	Pred Formula Profits (\$M) 2	Fit Least Squares					0.7592	608.71	451.34	8

Outliers, Missing Values, and Patterns

The screenshot displays the JMP Pro interface for analyzing outliers. The 'Analyze' menu is open, and 'Screening' is selected, leading to a sub-menu where 'Explore Outliers' is highlighted. The 'Explore Outliers of # Employ' dialog box is open, showing the 'Quantile Range Outliers' method selected. The 'Tail Quantile' is set to 0.05 and 'Q' is set to 0. The dialog also includes options to restrict search to integers and show only columns with outliers. A summary table at the bottom of the dialog provides the following data:

Column	10% Quantile	90% Quantile	Low Threshold	High Threshold	Number of Outliers	Outliers (Count)
# Employ	4795.6	82860	-229398	317053	1	383220

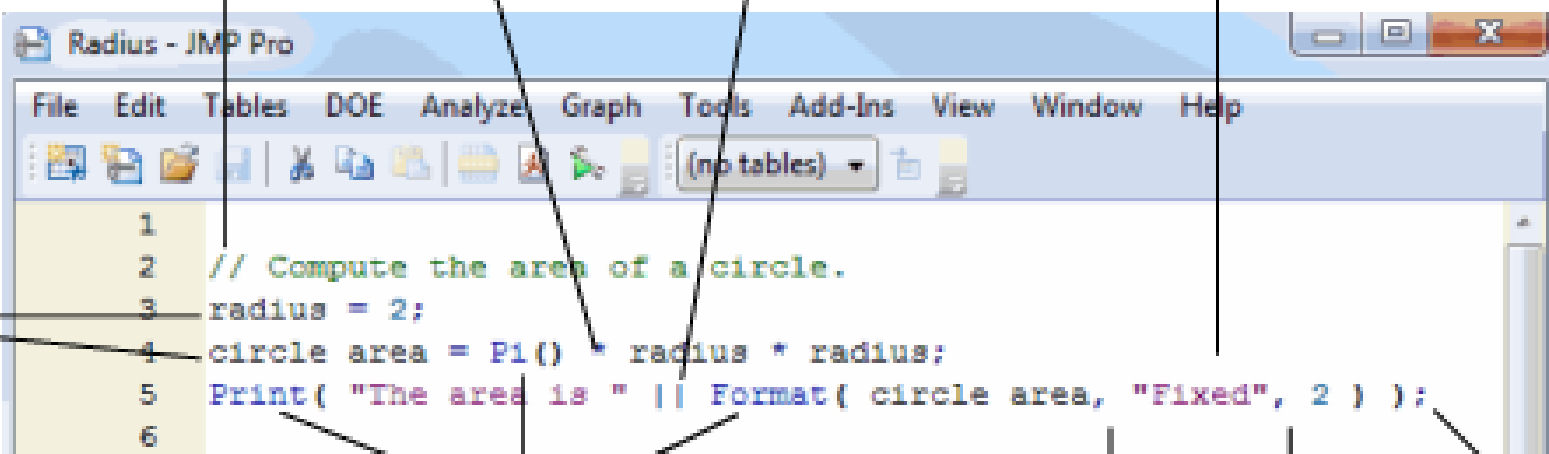

Plan

- Session 1
 - Workflow overview
 - Basic data manipulation
- Session 2
 - Join data tables
 - JMP graphing
- Session 3
 - Modelling
 - **JMP Journal**
 - **JMP Scripting Language**

JMP Journal – Communicate Your Results

- Create a JMP journal when you want to present your results
- A JMP journal combine two kind of presentations
 - Static: embed output of JMP (graphs and reports), fixed at a moment in time
 - Dynamic: built from outlines containing text and buttons (links) that organize data tables and reports
- Getting-started resources
 - Dmitry's video about JMP Journal on Quercus (6 mins)
 - [Creating, Using and Sharing JMP Journals](#) (1 hour 11 mins)

JMP Script Language (JSL)

The image shows a screenshot of the JMP Pro software interface with a JSL script editor. The script contains the following code:

```
1 // Compute the area of a circle.  
2 radius = 2;  
3 circle area = Pi() * radius * radius;  
4 Print( "The area is " || Format( circle area, "Fixed", 2 ) );  
5  
6
```

Annotations with arrows point to specific parts of the code:

- comment**: Points to the green text `// Compute the area of a circle.`
- multiplication operator**: Points to the asterisk `*` in `radius * radius`.
- concatenate operator**: Points to the vertical bar `||` in `"The area is " || Format(...)`.
- quoted text string**: Points to the double quotes in `"The area is "`.
- variables**: Points to `radius` and `circle area`.
- functions**: Points to `Pi()` and `Format(...)`.
- Commas separate arguments.**: Points to the commas in `Format(circle area, "Fixed", 2)`.
- Semicolons separate certain expressions.**: Points to the semicolons at the end of lines 3 and 4.

What's Next & Others

- JMP
 - Barely touched its surface (especially on modeling and experimental design)
 - Continue to learn JMP on your own
 - Use it as a stepping stone to learn concepts and other tools/languages
- A tip on preparing technical interview questions
 - Create a tech interview question list on your own; start now, and do it every day
- Tips on studying
 - Understand instead of memorizing
 - Learn academic, practical and soft skills
 - Manage your time well, and study hard, but don't be a perfectionist
 - Often take a moment to step back to see the big picture, and take it easy
 - Enjoy your learning journey
